

The benefits of BS 99001

bsi.

Inspiring trust for a more resilient world.

BS EN ISO 9001: Laying the foundation

BS EN ISO 9001 Quality management systems is the global standard for quality management, providing non-sector specific best practices for improving quality. For those construction businesses that have already adopted the guidance in **BS EN ISO 9001**, they are in a great position to refine and improve upon their quality management processes by implementing the industry-led recommendations in **BS 99001**.

BS 99001: The building blocks

BS 99001 Quality management in the built environment helps businesses to improve quality within their operations by building on the guidance in **BS EN ISO 9001** from a built environment approach. Adopting **BS 99001** can help you to increase the suitability, safety, and durability of your built assets, develop your expertise and efficiency in project-based quality management and demonstrate your commitment to quality assurance.

PD 99001: Cementing best practices

PD 99001 Incorporating BS 99001 requirements is a single document containing all the clauses of **BS EN ISO 9001** followed in turn by the respective clause content from **BS 99001**. This provides an easier, more concise way to understand how the requirements of **BS 99001** expand on the requirements of **BS EN ISO 9001** and therefore make it easier to implement both within your business.

Do you want to maximize the benefits of your quality management system?
Get BS 99001 today to help raise the bar on quality management across the built environment sector.
